# Data Services

## Practical data management

Data Governance is the exercise of authority and control (planning, monitoring and enforcement) over the management of data assets. Does your business require advice on its data strategy, data policies and data development? Do you require consultation on local or international protection of personal information legislation compliance?

We provide services from setting up a Data Governance Council through to a Data Quality Assessment. In addition to this, we strive to deliver the technical expertise and the insights you would need.

### Our services include:

- ✓ Strategic advisory services
- ✓ Data and information management readiness assessments
- ✓ Audit and rescue services
- ✓ Data and information management implementations
- ✓ Protection of personal information legislation compliance assessments

Our team consists of highly skilled and experienced individuals across the data management product sets. We are able to function in a myriad of roles within the data services field. We firmly believe in education and certification; with

experience in the DAMA International Certified Data Management Professional (CMDP) accreditation.

Advance Data Services employs the DAMA International Data Management Body of Knowledge as our preferred data services methodology framework. The DMBok framework represents not only the accepted functions of data management, but also suggests the activities, tasks, processes and procedures to be followed.

Our Data Services framework maps directly to the functions of data governance and employs a practical approach to managing data.
